

# WWW Applications

## Lab. 3

dr inż. Jakub Długosz

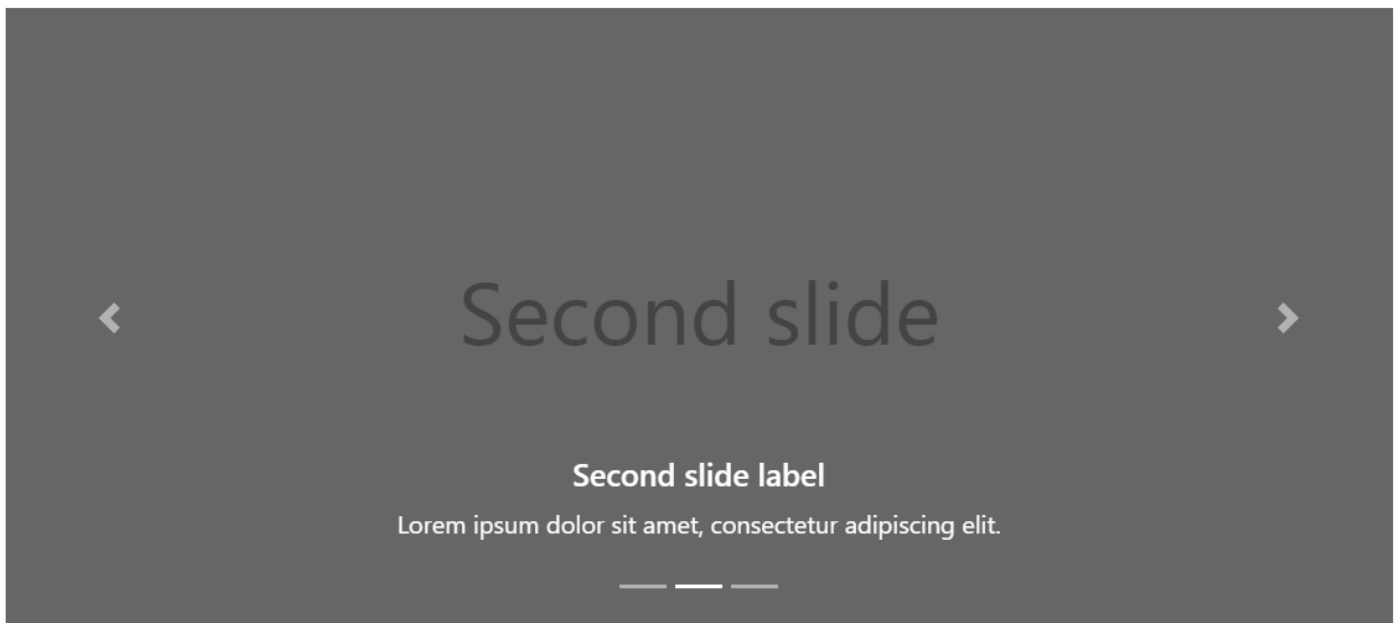

The purpose of this list is to use the components and patterns that Bootstrap library provides. This list project development should be managed under VCS (Version Control System) as git / github.

For information on the Bootstrap library, see site <https://getbootstrap.com/>.

### Task 1

Using Bootstrap, create a website. In your project, use elements such as:

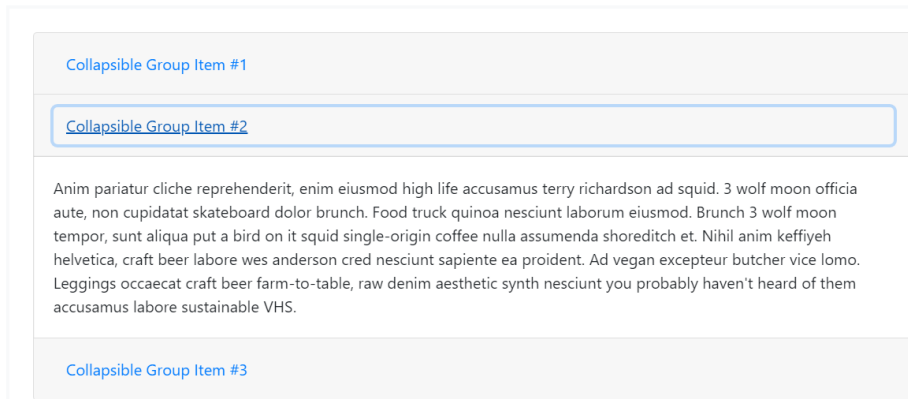

1. **navbar** navigation element with **scrollspy** element
2. **breadcrumb** navigation
3. **carousel element** with **controls**, **indicators** and **captions**:

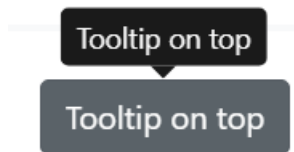

4. **accordion** (set of elements that can be rolled up and unfolded by clicking on them)

### Accordion example

Using the `card` component, you can extend the default collapse behavior to create an accordion. To properly achieve the accordion style, be sure to use `.accordion` as a wrapper.

5. **a form** in which page visitor will be able to enter their name, surname, e-mail, telephone number, street, house number / flat number, zip code, city and province and click on the "Submit" or "Reset" button
6. element, clicking on which will **display a modal window that takes up the entire available width and height of the display device**
7. **tooltips** elements that provide tips (hints) when the mouse cursor is placed over a specific interactive element or text fragment

### Remark 1

Make your website **responsive** and **change its layout with both 576px and 992px display device widths**.

### Remark 2

Use **VCS** as git / github **to track development of** (changes in) **your project**.
